Re: Transfer WI-2026-014

Dear colleagues,

Please find enclosed the case manifest for the thirty brain specimens shipped under transfer WI-2026-014. Tissue was taken from the regions indicated and has been held continuously at -80 °C.

One correction. The manifest was typeset on 12 June. Since then two cases — BINC-24-020 and BINC-24-024 — were re-reviewed by a second neuropathologist and their CTE stage was revised downward from IV to III. The enclosed PDF still shows the original assignment. Please use Stage III for these two cases and disregard what the manifest says. We will reissue the document in due course but did not want to hold up the shipment.

Cases marked with a dagger carry comorbid neurodegenerative pathology — most commonly hippocampal sclerosis with TDP-43, occasionally Alzheimer-type change. We have not excluded them, but you may wish to.

Our controls are age-matched brain-bank donors with no documented history of repetitive head impact. Do let me know if you need anything further.

With best wishes,

A handwritten signature in blue ink, appearing to read 'Margaret Ellory', with a stylized, wavy line extending from the end.

Margaret Ellory, MD, PhD

Director, Neuropathology Core
